Coursera Capstone Project

The Battle of Neighborhoods

By Cheung Ngai Lam Irene

Introduction

- Singapore -- there are a lot of tourist visit all year around. They like to do a lot of sightseeing around the city.
- After a long day, tourist would like to take a rest and have a cup of coffee to relax in this beautiful place. Therefore, it is an opportunity to open coffee shop.
- If someone is looking to open a coffee shop in Singapore, the question is where would you recommend them to open it? The business problem is that in order for a coffee shop to be profitable, there must be enough customers. It is not worth to open a new coffee shop in the immediate proximity of existing ones.

Business Problem

- The objective of this project is to analyze and select the best locations in Singapore to open a new coffee shop. Using data science methodology to provide business solution.
- Let's also make sure that audience is explicitly defined to be the local restaurant entrepreneur in Singapore and they care about this problem because the location of the new coffee shop has the significant impact on its revenue and they want this to be a successful one.

Data

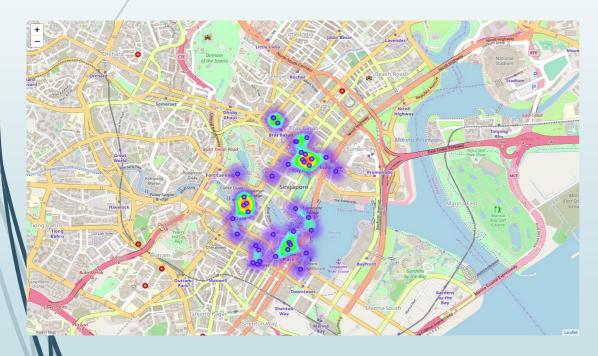

- The data used to solve this problem is geolocation data collected from FourSqure.com.
- Foursquare has one of the largest database of 105+ million places and used by over 125,000 developers. Foursquare API will provide many categories of the venue data, we are particularly interested in the coffee shop category in order to help us to solve the business problem.
- Data is a single dataframe, containing at least a location of the coffee shop.
- Explanation of the location data is a standard tuple (lat, lng), where lat stands for latitude and lng for longitude. Some other metadata such as name, postal code, and etc., are also collected.

Methodology

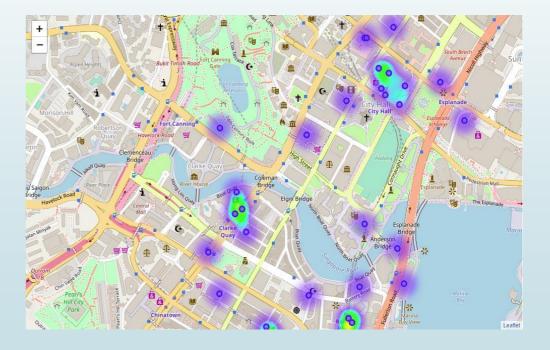

- Use Foursquare API to get the top 50 venues that are within a radius of 1000 meters.
- Need to have a Foursquare Developer Account in order to obtain the Foursquare ID and Secret Key.
- Make the API calls to Foursquare passing in the geographical coordinates of the neighborhoods. Foursquare will return the venue data in JSON format and we will extract the venue name, venue category, venue address, venue latitude and venue longitude.
- With the data, we can filter the "Coffee Shop" as venue category for the neighborhoods.

Methodology

Map 1: Data visualized to the map of Singapore, including heatmap-based kernel density estimation

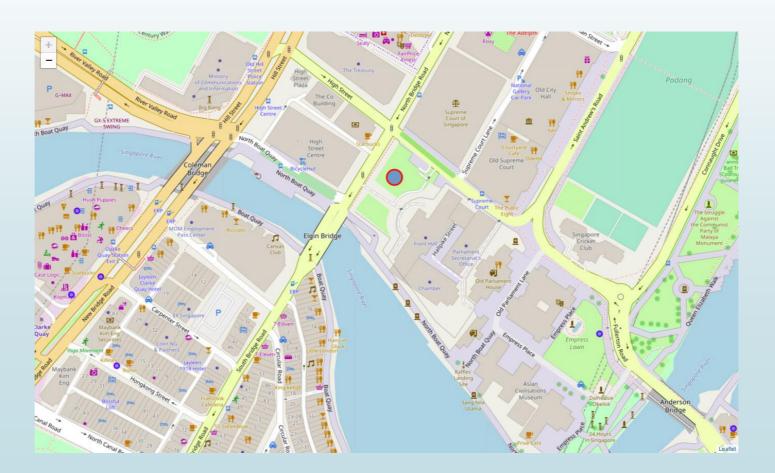

Map 2: The zoom in version of the Data visualized to the map of Singapore

Result

Based on the preliminary result, one possible good location for the new coffee shop would be in crossroad of North Bridge Road and High Street, which is inside the park near the Parliament of Singapore

Discussion

- Compare with the map in the Result section and the heatmap-based kernel density estimation in the Methodology section, you see that most of the coffee shops are concentrated near the City Hall of Singapore.
- There is nearly no coffee shop near the Singapore River.
- This represents a great opportunity and high potential area to open a new coffee shop as there is very little to no competition from existing coffee shop.
- Tourist can enjoy a cup of coffee and relax a bit after a long day of sightseeing in this beautiful place.

Conculsion

- The optimal location for the new coffee shop would be in crossroad of North Bridge Road and High Street, which is inside the park near the Parliament of Singapore.
- It is recommended to the management team to re-run this data science program to get the updated result and use the result into consideration as part of the business growth plan in selecting the new neighborhood to offer their new coffee shop.
- This is critical not only to make sure that they got the updated result for better decision making, but also to make sure that they can revalidate the finding from this project.

Thank You
